

Week 2 – Multi-Language Support

Summary:

Week 2 focused on implementing execution support for multiple programming languages. The backend was extended to **accept and execute Python, C, C++, and Java code**, including input/output handling and error logging.

Key Activities:

- Study and implementation of language execution pipelines using Python **subprocess** module.
- Developed FastAPI endpoints for each language.
- Implemented **input/output handling** and **error logging** for all supported languages.
- Integrated testing for multi-language execution.

Technologies Used: Python, FastAPI, GCC, g++, JDK

Outcome:

Backend successfully supports multiple languages with input/output handling and error management.

Flowchart:
