

Week 17 – Container Management & Docker Optimization

Summary:

Week 17 focused on **improving Docker container management** and optimizing backend deployment.

Key Activities:

- Optimized **Dockerfiles** for faster build and smaller image size.
- Implemented **container cleanup scripts** to remove unused containers automatically.
- Verified **volume mapping and temp file management** for each language execution.
- Tested **container restart and recovery mechanisms**.

Technologies Used: Docker, FastAPI, Python, WSL2, Linux

Outcome:

Docker-based backend is now **efficient, clean, and easier to maintain**, ensuring smooth multi-language execution.
