

Week 20 – Backend Validation & Output Verification

Summary:

This week focused on validating the correctness of outputs generated by the multi-language compiler backend.

Key Work Performed:

- Executed programs written in different programming languages using the backend.
- Verified correctness of outputs for normal and edge-case inputs.
- Checked runtime errors, compilation failures, and execution behavior.
- Ensured backend stability while running multiple test programs.

Technologies Used:

Python, FastAPI, Docker, WSL2, Linux

Outcome:

The backend consistently produced correct outputs and handled errors properly across all supported languages.
