

Week 21 – Backend Optimization & Resource Management

Summary:

This week emphasized optimizing backend performance and managing system resources efficiently.

Key Work Performed:

- Monitored CPU and memory usage during program execution.
- Improved container cleanup after program completion.
- Reduced execution overhead by refining Docker configuration.
- Ensured stable performance during repeated executions.

Technologies Used:

Docker, FastAPI, Python, Linux (WSL2)

Outcome:

Backend performance was optimized, ensuring efficient execution and proper resource utilization.
