

Week 22 – Error Handling & Exception Management

Summary:

This week focused on improving error handling mechanisms within the compiler backend.

Key Work Performed:

- Improved detection of compilation and runtime errors.
- Categorized errors such as syntax errors, runtime exceptions, and logical errors.
- Ensured meaningful error messages were returned via backend APIs.
- Tested backend behavior for invalid and incomplete code submissions.

Technologies Used:

Python, FastAPI, Docker, WSL2

Outcome:

Backend became more reliable with clear and accurate error reporting.
