

Week 4 – Graphics & Library Testing

Summary:

Week 4 focused on testing **graphical and computational Python libraries** within the backend environment. This ensured the compiler can execute programs with graphics or complex calculations.

Key Activities:

- Tested **Matplotlib, OpenCV(headless)** inside Docker container.
- Verified backend execution for programs requiring **input, output, computation, and graphical display**.
- Documented test results and prepared summary for diary.

Technologies Used: Python, FastAPI, Docker

Outcome:

Backend fully supports graphical and computational tasks inside a stable Docker container. System ready for future frontend integration.
